

Singletons

Design pattern for a class:

which ensures that you can just create 1 object of that class.

Class A
private A();
get Instance();

Caller

A a₁ = new A(); → object creation
↳ constructor is called

we have to stop this constructor call.

✓ A a₁ = A.get Instance() → 123

A a₂ = A.get Instance() → 123 ✓

class A {
private static A a;
memory → null → can we keep it final ??

private A() { }

Static A get Instance() {

if (a == null) {

a = new A();

return a;

return a;

only time we create object
